Geopolitics of Cyberspace and Cybergeography

Abstract: This article discusses how “geopolitical thinking” can be applied to cyberspace in light of the capacity to understand it as a geographical space. The interpretation of cyberspace as a territory is twofold. On the one hand, cyberspace sees a given territory in terms of both anarchic and open place regulated and driven by the role of Nation- State. On another hand, Nation-States follow up such understanding, which can be seen from the analysis of the interpretation of cyberspace on their part, as well as from the application over the cyberspace of territorial practices that are traditionally applied in physical territories.

Keywords: Cyberspace, Geopolitics of cyberspace, Cybergeography, Critical geography.
