The European Health Data Space: a Matter of Public Ethics

Abstract: The crisis of Europe is a recurring theme, made evident by the difficulty of member countries in responding effectively to military and economic conflicts, as well as threats to the independence of the European Union. It is argued by many that Europe is not a true union, but merely an ideal detached from reality, where fundamental rights, considered acquired, are constantly at risk due to the influence of external powers. However, it is important to recognize the value of achievements made in the name of unity. Among these, the European Health Data Space (EHDS) represents a significant example. In this contribution, I will briefly examine, from a public ethics perspective, the meaning of this achievement, its objectives, the principles that support it, the potential criticalities that could compromise it.

Keywords: Solidarity, Consent, Public health, Rights.
